[57] Abstract:

PROBLEM TO BE SOLVED: To obtain a water-dispersible agrochemical preparation excellent in storage stability. SOLUTION: This water-dispersible agrochemical preparation is the one containing a herbicidally active compound whose melting point is 30- 100°C, a surfactant and a hydrated silicic acid salt. Preferably, the hydrated silicic acid salt is hydrated calcium silicate, and the crystalline form is the gyrolite type one. The apparent specific gravity of the hydrated silicic acid salt is preferably 0.05-0.2, and the oil absorption thereof is preferably 300-1,500 ml/100 g.
